

CVP Spin Overlay (TM)

Integrity + Reproducibility Plane for Distributed Compute

Detect silent drift | Localize first divergence | Prevent state-state propagation | Replayable proof artifacts

The Problem

Correctness breaks quietly at scale

- Silent wrong: plausible outputs from drifting or corrupted state.
- Nondeterminism across ranks/streams makes issues unreproducible.
- Reruns burn GPU weeks; RCA becomes a major incident.
- Audit logs are not independently verifiable proof.

Wedge to Expansion

One primitive set, multiple large lanes

- Wedge: enterprise LLM training teams (debug cost is enormous).
- Finance/Wagering: dispute-grade integrity and chain-of-custody evidence.
- Telecom/Network: change integrity, drift detection, faster rollback.
- Industrial/Grid/Energy: safety envelope and verified-only actuation.

The Solution

Boundary-first integrity plane + proof artifacts

- Instrument compute, collective, I/O, and state-transition boundaries.
- Compute configurable invariants with low-overhead sampling policies.
- Emit integrity events and first-divergence localization (step/op/rank).
- State-state gating for regulated and safety-critical lanes.
- Proof Bundles and validator enable deterministic container replay.
- Evidence Packets for engineering and governance/compliance review.

Moat

IP + standards + certification + workflow lock-in

- Patent portfolio across platform, sector embodiments, and certification.
- Policy DSL plus schema/validator plus evidence packet standard.
- Verified certification plus recertification (recurring revenue, switching cost).

Why Now

Spend is up; tolerance for unreproducible runs is down

- AI factories at scale make correctness a throughput constraint.
- Regulated AI and critical systems increasingly require evidence.

Business Model

Pilot to license to certification attach

- Paid pilots (30-60 days) to annual license plus sector addendum.
- Optional regulated tier with Verified certification and recertification.

Raise and Near-Term Milestones (Base Case)

\$12M

Seed (12-18 months)

2-3

Design-partner pilots

1

Production conversion

- Ship: evidence packet standard + validator + replay pass/fail reports
- Launch: Verified certification profile + recertification workflow
- Convert: first production logo + expansion plan across lanes
